INTEGRAL AVERAGES AND OSCILLATION CRITERIA FOR
HALF–LINEAR PARTIAL DIFFERENTIAL EQUATION

ROBERT MAŘÍK

E-MAIL: MARIK@MENDELU.CZ

Abstract. The technique of weighted integral averages, known in the oscil-
lation theory of ordinary differential equations, is extended to the half–linear
partial differential equation
\[ \text{div}(|\nabla u|^{p-2}\nabla u) + c(x)|u|^{p-2}u = 0, \quad p > 1 \] 
(E)

This technique is used to obtain new oscillation criteria for (E) on the un-
bounded domains.

Keywords. \( p \)-Laplacian, oscillatory solution, Riccati equation, partial dif-
ferential equation, half–linear equation

AMS Class. 35J60, 35B05

Running head: Integral averages and PDE

1. Introduction

Consider the partial differential equation with \( p \)-Laplacian and the nonlin-
earity of the Emden-Fowler type
\[ \Delta_p u + c(x)\Phi(u) = 0, \] 
where \( \Delta_p u \equiv \text{div}(|\nabla u|^{p-2}\nabla u) \), \( p > 1 \) is the \( p \)-Laplacian, \( \Phi(u) = |u|^{p-2}u = |u|^{p-1}\text{sgn }u \), \( x = (x_i)_{i=1}^n \in \mathbb{R}^n \), \( \| \cdot \| \) is the usual Euclidean norm in \( \mathbb{R}^n \) and
\( \nabla = (\frac{\partial}{\partial x_i})_{i=1}^n \) is the usual nabla operator.

The equations with \( p \)-Laplacian have applications in various physical and
biological problems — in the study of non-Newtonian fluids, in the glaciology
and slow diffusion problems. For more detailed discussion about applications
of equations with \( p \)-Laplacian the reader is referred to [2] and the references therein.

Among the equations with \( p \)-Laplacian equation (E) plays a special role.
Since both terms \( \Delta_p u \) and \( \Phi(u) \) are homogeneous functions of the degree \( p - 1 \),
(E) has the so-called half–linear property: the constant multiple of every solution
is also a solution of (E). From this reason some of the qualitative properties of
half–linear equation (E) are similar to the properties of linear Schrödinger partial

\^\text{0}\text{Supported by the Grant 201/01/0079 of the Czech Grant Agency}
differential equation

\[ \Delta u + c(x)u = 0 \]  (L)

which can be obtained from (E) for \( p = 2 \). Especially the Sturmian type theorems extends from (L) also to (E), see [6, 8].

**Notation:** \( \Omega(a), \Omega(a, b), S(a), D \) and \( D_0 \) are the sets in \( \mathbb{R}^n \) and \( \mathbb{R} \times \mathbb{R}^n \) defined as follows:

\[
\begin{align*}
\Omega(a) &= \{ x \in \mathbb{R}^n : a \leq ||x|| \}, \\
\Omega(a, b) &= \{ x \in \mathbb{R}^n : a \leq ||x|| \leq b \}, \\
S(a) &= \{ x \in \mathbb{R}^n : ||x|| = a \}, \\
D &= \{ (t, x) \in \mathbb{R} \times \mathbb{R}^n : t \geq ||x|| \geq t_0 \}, \\
D_0 &= \{ (t, x) \in \mathbb{R} \times \mathbb{R}^n : t > ||x|| \geq t_0 \},
\end{align*}
\]

the number \( q \) is a conjugate number to the number \( p \), i.e., \( q = \frac{p}{p-1} \), \( \langle \cdot, \cdot \rangle \) denotes the usual scalar product in \( \mathbb{R}^n \), \( \omega_n \) is the surface of the unit sphere in \( \mathbb{R}^n \). Integration over the domain \( \Omega(a, b) \) is performed introducing hyperspherical coordinates \((r, \theta)\), i.e.

\[
\int_{\Omega(a, b)} f(x) \, dx = \int_a^b \int_{S(r)} f(x(r, \theta)) \, dS \, dr,
\]

where \( dS \) is the element of the surface of the sphere \( S(r) \).

The function \( c(x) \) is assumed to be locally Hölder continuous on \( \Omega(t_0) \). The solution of equation (E) is every function which satisfies (E) everywhere on \( \Omega(t_0) \).

The oscillation properties of equation (E) and its generalizations, which includes also the half–linear partial differential equation with \( p \)-Laplacian (E) has been extensively studied in the literature, see e.g. [1, 6–8, 14, 15, 17–20, 22, 23]. The oscillation theory of (E) recognizes two types of oscillation. Equation (E) is said to be weakly oscillatory if every its solution has a zero outside of every ball in \( \mathbb{R}^n \) and strongly oscillatory if every solution has a nodal domain outside of every ball in \( \mathbb{R}^n \). Moss and Piepenbrick [16] showed that both definitions are equivalent if the function \( c(x) \) is locally Hölder continuous. As far as the author knows, the possible equivalence between both types of oscillation remains an open question for (E). In the paper the first type of oscillation is used.

**Definition 1.1.** Let \( \Omega \) be unbounded domain in \( \mathbb{R}^n \). Equation (E) is said to be oscillatory in \( \Omega \) if every its nontrivial solution defined on \( \Omega \cap \Omega(t_0) \) has zero in \( \Omega \cap \Omega(t) \) for every \( t \geq t_0 \). Equation (E) is said to be oscillatory, if it is oscillatory in \( \mathbb{R}^n \).

The oscillation criteria are usually expressed in terms of integrals of the potential function \( c(x) \) over the balls centered in the origin. Let us mention the following theorem, well-known in the area of second-order linear ordinary differential equations.
Theorem A (Hartman–Wintner type oscillation criterion, [14]). Denote

\[ C(t) = \frac{p-1}{tp^{-1}} \int_1^t s^{p-2} \int_{b(1,s)} ||x||^{1-n} c(x) \, dx \, ds. \]

If

\[ -\infty < \liminf_{t \to \infty} C(t) < \limsup_{t \to \infty} C(t) \leq \infty \quad \text{or if} \quad \lim_{t \to \infty} C(t) = \infty, \]

then equation (E) is oscillatory.

Very general oscillation criterion which deduces oscillation of (E) from oscillation of ordinary half–linear differential equation is due to Jaroš, Kusano and Yoshida [8]. A variant of this theorem has been proved independently also by Došlý and Mařík [6].

Theorem B ([6]). Let

\[ \tilde{c}(r) = \frac{1}{\omega_n r^{n-1}} \int_{S(r)} c(x) \, dS. \]

Equation (E) is oscillatory, if the ordinary differential equation

\[ (r^{n-1}\Phi(y'))' + r^{n-1}\tilde{c}(r)\Phi(y) = 0 \quad (1.1) \]

is oscillatory.

Oscillation criteria for equation (1.1) can be found in [3–5,9,11–13].

The disadvantage of the criteria in Theorems A and B lies in the fact that preferring integration over the balls in \( \mathbb{R}^n \) we loose the information about the distribution of the potential \( c(x) \) over the sphere \( S(r) \). However, the distribution of potential over the sphere may be substantial in the cases when Theorem B is not applicable. If the function \( \tilde{c}(x) \) is sufficiently small, equation (1.1) is nonoscillatory, but equation (E) still may be oscillatory.

Philos [21] used a class of functions \( H(t,s) \) to obtain oscillation criteria for linear second order Sturm–Liouville differential equation. This technique, usually referred as averaging technique, has been elaborated and extended e.g. in [10,13,24] also for other types of ordinary differential equations. Let us point out the paper [24], where the usual condition \( \frac{\partial H(t,s)}{\partial s} \leq 0 \) is relaxed.

The aim of this paper is to extend the averaging technique also for the partial differential equation (E) and obtain new oscillation criteria, which can remove the disadvantage of Theorems A and B. It is also showed, that this technique allows obtain oscillation criteria not only for the exterior of a ball, but also for different types of unbounded domains.

The paper is divided into three sections. Main results and comments are presented in the next section. The last section contains proofs of theorems.
2. Main results

First let us present a direct extension of [24, Theorem 1] to the case of equation (E).

**Theorem 2.1.** Let \( H(t,x) \in C(D, [0, \infty)) \), and \( \rho(x) \in C^1(\Omega(t_0), (0, \infty)) \) be such that the function \( H(t,x) \) has a continuous partial derivative with respect to \( x_i \) (\( i = 1..n \)) on \( D_0 \) and the following conditions hold

(i) \( H(t,x) = 0 \) iff \( t = ||x|| \)

(ii) There exists function \( k(s) \in C([t_0, \infty), (0, \infty)) \) such that the function

\[
 f(t, s) = k(s) \int_{S(s)} H(t, x) \, dS
\]

is nonincreasing with respect to \( s \) for every \( t \geq s \geq t_0 \).

(iii) The vector–valued function \( h(t,x) \) defined on \( D_0 \) by

\[
h(t,x) = \nabla H(t,x) + \frac{H(t,x)}{\rho(x)} \nabla \rho(x)
\]

satisfies

\[
 \int_{\Omega(t_0,t)} H^{1-p}(t,x)||h(t,x)||^p \rho(x) \, dx < \infty
\]

for \( t > t_0 \).

If

\[
 \limsup_{t \to \infty} \left( \int_{S(t_0)} H(t,x) \, dS \right)^{-1} \times \int_{\Omega(t_0,t)} \left[ H(t,x) \rho(x)c(x) - \frac{||h(t,x)||^p \rho(x)}{p^p H^{p-1}(t,x)} \right] \, dx = \infty,
\]

then \( (E) \) is oscillatory.

The following theorem is a variant of the preceding one. In contrast to Theorem 2.1 the function \( H(t,x) \) is not necessary to be positive for \( t_0 \leq ||x|| < t \) in theorems bellow, but can attain also zero values. This allows to eliminate “bad parts” of the potential \( c(x) \) from our considerations. We will use the following additional notation

\[
\Omega_{a,b} = \{ x \in \mathbb{R}^n : a \leq ||x|| \leq b, H(t,x) \neq 0 \},
\]

\[
S_{a} = \{ x \in \mathbb{R}^n : ||x|| = a, H(t,x) \neq 0 \}.
\]

This allows us to exclude the parts of the sets \( \Omega(a,b) \) and \( S(a) \), where the function \( H(t,x) \) equals zero, from the area of integration.

**Theorem 2.2.** Let \( H(t,x) \in C(D, [0, \infty)) \), and \( \rho(x) \in C^1(\Omega(t_0), (0, \infty)) \) be such that that the function \( H(t,x) \) has a continuous partial derivative with respect to \( x_i \) (\( i = 1..n \)) on \( D_0 \) and the following conditions hold

(i) \( ||x|| = t \geq t_0, then H(t,x) = 0 \)

(ii) \( H(t,x) = 0 \) for some \( (t, x) \in D_0 \), then \( ||\nabla H(t,x)|| = 0 \)
(iii) There exists function $k(s) \in C([t_0, \infty), (0, \infty))$ such that the function 
$f(t, s) := k(s) \int_{S(s)} H(t, x) \, dS = k(s) \int_{S_0(s)} H(t, x) \, dS$ is positive and
nonincreasing with respect to $s$ for every $t > s \geq t_0$.

(iv) The vector–valued function $h(t, x)$ defined on $D_0$ by $2.1$ satisfies
\[
\int_{\Omega_{0, t}} H(t, x) |h(t, x)|^p \rho(x) \, dx < \infty \quad \text{for } t > t_0.
\]

If
\[
\limsup_{t \to \infty} \left( \int_{S(t_0)} H(t, x) \, dS \right)^{-1} \times \int_{\Omega_{0, t}} \left[ H(t, x) \rho(x) c(x) - \frac{|h(t, x)|^p \rho(x)}{p^p H^{p-1}(t, x)} \right] \, dx = \infty \quad (2.5)
\]
then $[E]$ is oscillatory.

Remark 2.1. Condition $[iii]$ claims that the set $S_{0,t}(s)$ is nonempty for every $t$
satisfying $t_0 < s < t$. Hence the function $H(t, x)$ has parts with positive values
on every sphere centered in the origin.

Remark 2.2. Under $[ii]$ we understand that the function $g(t, s)$ defined for
$t_0 < s < t$ by
\[
g(t, s) := \int_{S_0(s)} H^{1-p}(t, x) \rho(x) |h(t, x)|^p \, dS \quad (2.6)
\]
is integrable with respect to $s$ over the interval $(t_0, t)$. (The point $t$ may be a
singular point of the integral, since $H(t, x) = 0$ for $|x| = t$.) A similar commentary
explains also, how to understand $[2.4]$.

Remark 2.3. Let $\Omega \subset \Omega(t_0)$ be unbounded domain with smooth boundary $\partial \Omega$. If
in addition to the conditions of Theorem $[2.2]$ the function $H(t, x)$ vanishes outside
$\Omega$ and both $H(t, x)$ and $|\nabla H(t, x)|$ vanishes on $\partial \Omega$ for every $t \geq t_0$, then it
follows that equation $[E]$ is oscillatory in $\Omega$. Hence Theorem $[2.2]$ can be used to
formulate explicit oscillation criteria on different types of domains, than exterior
of the ball. This situation cannot be covered by Theorem $[2.2]$ Remark also that
Kneser–type criteria for oscillation and nonoscillation of linear PDE in various
types of unbounded domain can be found in $[1]$. Examples of the oscillation criteria
on the half–plane are given below.

The following Corollary is an immediate consequence of Theorem $[2.2]$

\[
\limsup_{t \to \infty} \left( \int_{S(t_0)} H(t, x) \, dS \right)^{-1} \times \int_{\Omega_{0, t}} \frac{|h(t, x)|^p \rho(x)}{H^{p-1}(t, x)} \, dx < \infty \quad (2.7)
\]
and
\[
\limsup_{t \to \infty} \left( \int_{S(t_0)} H(t, x) \, dS \right)^{-1} \int_{\Omega(t_0, t)} H(t, x) \rho(x) c(x) \, dx = \infty, \tag{2.8}
\]
then \(E\) is oscillatory.

The following theorem extends [24, Theorem 2].

**Theorem 2.3.** Let the functions \(H, h, k\) and \(\rho\) satisfy the hypotheses (iii)–(iv) of Theorem 2.2. Suppose also that
\[
0 < \inf_{s \geq t_0} \left\{ \liminf_{t \to \infty} \frac{k(s) \int_{S(s)} H(t, x) \, dS}{k(t_0) \int_{S(t_0)} H(t, x) \, dS} \right\}, \tag{2.9}
\]
and (2.7) holds. If there exists a function \(A \in C(\Omega(t_0), \mathbb{R})\) such that
\[
\inf_{t \in (T, \infty)} \left\{ \left( \int_{S(T)} H(t, x) \, dS \right)^{-1} \int_{\Omega(t_0, t)} \left[ H(t, x) \rho(x) c(x) - \frac{|h(t, x)|}{\rho H^{-1}(t, x)} \right] \, dx \right\} \geq A(T) \tag{2.10}
\]
for \(T \geq t_0\) and
\[
\int_{t_0}^{\infty} (A_+(T))^q \hat{\rho}^{1-q}(T) k^{-1}(T) \, dT = \infty, \tag{2.11}
\]
where \(A_+(T) = \max\{A(T), 0\}\) and
\[
\hat{\rho}(T) = \sup_{t > T} \left\{ \int_{S(T)} H(t, x) \, dS \right\}^{-1} \int_{S(T)} \rho(x) H(t, x) \, dS \right\}, \tag{2.12}
\]
then \(E\) is oscillatory.

**Remark 2.4.** The supremum in (2.12) always exists, since
\[
\left( \int_{S(T)} H(t, x) \, dS \right)^{-1} \int_{S(T)} \rho(x) H(t, x) \, dS \leq \max_{x \in S(T)} \{\rho(x)\}.
\]

**Remark 2.5.** Comparing Theorem 2.3 with Theorem 2 of [24], we see that in the case of ordinary differential equations the condition (2.10) replaced by a weaker condition where \(\limsup_{t \to \infty}\) stays instead of \(\inf_{t \in (T, \infty)}\). The reason, why we need the stronger condition (2.10) instead is the following. In the proof of Theorem 2.3 we estimate the function \(A(T)\) from above with help of solution of Riccati equation — see (3.19) below. This bound does not depend on the value of \(t\) in the case of ODE, however depends on \(t\) in the case of equation (E).

The following theorem extends [24, Theorem 3].
Theorem 2.4. Let the functions $H$, $h$, $k$ and $\rho$ satisfy the hypotheses (i)-(iv) of Theorem 2.2. Suppose also that (2.9) and
\[
\lim_{t \to \infty} \left( \int_{S(t_0)} H(t, x) \, dS \right)^{-1} \int_{\Omega(t_0, t)} H(t, x) \rho(x) \, dx < \infty. \tag{2.13}
\]
If there exists a function $A \in C(\Omega(t_0), \mathbb{R})$ such that (2.10) and (2.11) hold, then (E) is oscillatory.

Example 2.1. Consider the Schrödinger partial differential equation (1) in $\mathbb{R}^2$, i.e., $n = p = 2$. For $\lambda > 1$ define the functions $H$, $k$ and $\rho$ as follows:
\[
\rho(x) \equiv 1 \quad \text{for} \ x \in \mathbb{R}^2,
\]
\[
k(s) = \frac{1}{s} \quad \text{for} \ s > 1,
\]
\[
H(t, x) = \begin{cases} (t-r)^{\lambda} \sin^2 \phi & \phi \in [0, \pi) \\ 0 & \phi \in [\pi, 2\pi), \end{cases}
\]
where $r$ and $\phi$ are the radial and the polar coordinates of the point $x \in \mathbb{R}^2$. It is easy to see that $S_{t,0}(s)$ is the top half-circle with radius $s < t$ and $\int_{S(t)} H(t, x) \, dS = \frac{\pi}{2} (t - s)^{\lambda}s = O(t^\lambda)$. Since $\rho(x) \equiv 1$, $h(t, x) = \nabla H(t, x)$ holds and consequently
\[
||h(t, x)||^2 = \begin{cases} 2(t-r)^{2\lambda-2} \sin^2 \phi + 4 \frac{(t-r)^{2\lambda}}{r^2} \sin^2 \phi \cos^2 \phi & \phi \in [0, \pi) \\ 0 & \phi \in [\pi, 2\pi) \end{cases}
\]
Direct computation shows
\[
H^{-1}(t, x)||h(t, x)||^2 = \lambda^2(t-r)^{\lambda-2} \sin^2 \phi + 4 \frac{(t-r)^{\lambda}}{r^2} \cos^2 \phi
\]
for $x \in \Omega_{t,0}(t_0)$ and (2.4) clearly holds. Further (2.5) has the form
\[
\lim_{t \to \infty} t^{-\lambda} \int_{M(t)} \left[ c(x(r, \phi))(t-r)^{\lambda} \sin^2 \phi - \frac{\lambda^2}{4} (t-r)^{\lambda-2} \sin^2 \phi \frac{(t-r)^{\lambda}}{r^2} \cos^2 \phi \right] \, dx = \infty, \tag{2.14}
\]
where $M(t) = \{(x_1, x_2) \in \mathbb{R}^2 : 1 \leq x_1^2 + x_2^2 \leq t^2, x_2 > 0\}$. Since
\[
\lim_{t \to \infty} t^{-\lambda} \int_{M(t)} (t-r)^{\lambda-2} \sin^2 \phi \, dx = \lim_{t \to \infty} t^{-\lambda} \frac{\pi}{2} \int_1^t r(t-r)^{\lambda-2} \, dr
\]
\[
\leq \lim_{t \to \infty} t^{-\lambda} \frac{\pi}{2} \int_1^t (t-r)^{\lambda-2} \, dr
\]
\[
= \frac{\pi}{2} \frac{1}{\lambda - 1} \lim_{t \to \infty} t^{1-\lambda}(t-1)^{\lambda-1} < \infty,
\]
is (2.14) equivalent to
\[
\limsup_{t \to \infty} t^{-\lambda} \int_{M(t)} \left[ c(x(r, \phi))(t-r)^{\lambda} \sin^2 \phi - \frac{(t-r)^{\lambda}}{r^2} \cos^2 \phi \right] \, dx (r, \phi) = \infty. \tag{2.15}
\]
Hence (2.14) is sufficient for (L) to be oscillatory on the half-plane \( x_2 \geq 0 \).

**Example 2.2.** Let us consider the same equation as in the Example 2.1. Let us change the function \( \rho(x) \) into \( \rho(x) = \frac{1}{||x||} = \frac{1}{r} \). The computation in polar coordinates yields

\[
||h(t, x)||^2 = \lambda^2 (t - r)^{2\lambda-2} \sin^4 \phi + 2\lambda (t - r)^{2\lambda-1} r^{-1} \sin^4 \phi \\
+ (t - r)^{2\lambda} r^{-2} \sin^4 \phi + 4(t - r)^{2\lambda} r^{-2} \sin^2 \phi \cos^2 \phi
\]

for \( \phi \in [0, \pi) \) and \( ||h(t, x)||^2 = 0 \) otherwise. As in the preceding example, (2.4) holds. Further integrating in polar coordinates we ensure that (2.7) holds. Then the condition

\[
\limsup_{t \to \infty} t^{-\lambda} \int_{M(t)} c(x(r, \phi))(t - r)^{\lambda} r^{-1} \sin^2 \phi \, dx(r, \phi) = \infty
\]

is a sufficient condition for oscillation of equation (E) on the half-plane \( x_2 \geq 0 \).

**Remark 2.6.** In contrast to the results in Theorems A and B, the conditions in Examples 2.1 and 2.2 are not affected by the behavior of the function \( c(x) \) on the half-plane \( x_2 \leq 0 \), which may be “relatively bad”.

3. Proofs

**Proof of Theorem 2.1.** Suppose that (E) is not oscillatory. There exists \( T \geq t_0 \), such that (E) has a solution \( u \) positive on \( \Omega(T) \). The Riccati–type vector variable

\[
w(x) := \rho(x) \frac{||\nabla u(x)||^{p-2} \nabla u(x)}{\Phi(u(x))}
\]

is well–defined on \( \Omega(T) \) and satisfies

\[
\text{div} \, w(x) = \rho(x) \frac{\Delta u}{\Phi(u)} + ||\nabla u||^{p-2} \langle \nabla u, \nabla \rho(x) \rangle - (p - 1) \rho(x) \frac{||\nabla u||^p}{|u|^p}.
\]

The application of (E) and (3.1) gives

\[
\text{div} \, w(x) = -\rho(x)c(x) + \frac{1}{\rho(x)} \langle w(x), \nabla \rho(x) \rangle - (p - 1) \rho^{1-q(x)} ||w(x)||^q
\]

and equivalently

\[
\rho(x)c(x) = -\text{div} \, w(x) + \frac{1}{\rho(x)} \langle w(x), \nabla \rho(x) \rangle - (p - 1) \rho^{1-q(x)} ||w(x)||^q
\]
for $x \in \Omega(T)$. Multiplication of this equality by the factor $H(t, x)$ and integration over $\Omega(T, t)$ for $t > T$ yields

$$
\int_{\Omega(T, t)} H(t, x) \rho(x) c(x) \, dx = - \int_{\Omega(T, t)} H(t, x) \text{div} \, w(x) \, dx
+ \int_{\Omega(T, t)} H(t, x) \frac{1}{\rho(x)} \langle w(x), \nabla \rho(x) \rangle \, dx
- \int_{\Omega(T, t)} H(t, x) (p - 1) \rho^{1-q} ||w(x)||^q \, dx.
$$

From here we conclude that

$$
\int_{\Omega(T, t)} H(t, x) \rho(x) c(x) \, dx = - \int_{\Omega(T, t)} \text{div}(H(t, x) w(x)) \, dx
+ \int_{\Omega(T, t)} \langle \nabla H(t, x), w(x) \rangle \, dx + \int_{\Omega(T, t)} H(t, x) \frac{1}{\rho(x)} \langle w(x), \nabla \rho(x) \rangle \, dx
- \int_{\Omega(T, t)} H(t, x) (p - 1) \rho^{1-q} ||w(x)||^q \, dx.
$$

Application of Gauss-Ostrogradski theorem, the property (i) of the function $H(t, x)$ and (2.1) gives

$$
\int_{\Omega(T, t)} H(t, x) \rho(x) c(x) \, dx = \int_{\Omega(T, t)} H(t, x) \langle w(x), \nu \rangle \, dx
+ \int_{\Omega(T, t)} \langle h(t, x), w(x) \rangle \, dx - \int_{\Omega(T, t)} H(t, x) (p - 1) \rho^{1-q} ||w(x)||^q \, dx,
$$

(3.2)

where $\nu$ is the normal unit vector. From here and from the Young inequality

$$(p - 1)||X||^q - p(X, Y) + ||Y||^p \geq 0
$$

(3.3)

for $X = w(x) H^{\frac{3}{p}}(t, x) \rho^{-\frac{1}{p}}(x)$ and $Y = h(t, x) \rho^{\frac{1}{p}}(x) p^{-1} H^{\frac{1-p}{p-1}}(t, x)$ it follows

$$
\int_{\Omega(T, t)} H(t, x) \rho(x) c(x) \, dx
\leq \int_{S(T)} H(t, x) \langle w(x), \nu \rangle \, dx + \int_{\Omega(T, t)} \frac{||h(t, x)||^p \rho(x)}{p^p H^{p-1}(t, x)} \, dx.
$$

which is equivalent to

$$
\int_{\Omega(T, t)} \left[ H(t, x) \rho(x) c(x) - \frac{||h(t, x)||^p \rho(x)}{p^p H^{p-1}(t, x)} \right] \, dx \leq \int_{S(T)} H(t, x) \langle w(x), \nu \rangle \, dx
$$

Hence

$$
\int_{\Omega(T, t)} \left[ H(t, x) \rho(x) c(x) - \frac{||h(t, x)||^p \rho(x)}{p^p H^{p-1}(t, x)} \right] \, dx \leq w^*(T) \int_{S(T)} H(t, x) \, dS,
$$

(3.4)
where \( w^*(T) = \max_{x \in S(T)} \|w(x)\| \). Using (3.4) we are able to estimate the integral from the condition (2.3)

\[
\int_{\Omega(t_0,t)} \left[ H(t,x)\rho(x)c(x) - \frac{\|\delta(t,x)\|^{p}\rho(x)}{p^p H^{p-1}(t,x)} \right] \, dx \\
\leq \int_{\Omega(t_0,T)} H(t,x)\rho(x)c(x) \, dx + w^*(T) \int_{S(T)} H(t,x) \, dS \\
\leq \int_{t_0}^{T} \left[ \int_{S(s)} H(t,x) \, dS \right] k(s) \frac{\rho^*(s)c^*(s)}{k(s)} \, ds + \frac{w^*(T)}{k(T)} \int_{S(T)} H(t,x) \, dS
\]

for \( t > T \) where \( \rho^*(s) = \max_{x \in S(s)} \|\rho(x)\| \) and \( c^*(s) = \max_{x \in S(s)} \|c(x)\| \). Since \( f(t,s) := k(s) \int_{S(s)} H(t,x) \, dS \) is a nonincreasing function with respect to \( s \), the above inequality implies

\[
\int_{\Omega(t_0,t)} \left[ H(t,x)\rho(x)c(x) - \frac{\|\delta(t,x)\|^{p}\rho(x)}{p^p H^{p-1}(t,x)} \right] \, dx \\
\leq k(t_0) \left[ \int_{S(t_0)} H(t,x) \, dS \right] \left[ \int_{t_0}^{T} \frac{\rho^*(s)c^*(s)}{k(s)} \, ds + \frac{w^*(T)}{k(T)} \right]
\]

and hence

\[
\left( \int_{S(t_0)} H(t,x) \, dS \right)^{-1} \int_{\Omega(t_0,t)} \left[ H(t,x)\rho(x)c(x) - \frac{\|\delta(t,x)\|^{p}\rho(x)}{p^p H^{p-1}(t,x)} \right] \, dx \\
\leq k(t_0) \int_{t_0}^{T} \frac{\rho^*(s)c^*(s)}{k(s)} \, ds + \frac{k(t_0)w^*(T)}{k(T)}
\]

for large \( t \), which contradicts (2.3).

\[\square\]

**Proof of Theorem 2.2.** Assume the contradiction. As in the proof of Theorem 2.1 we conclude \( f(t,s) \) for \( t > T \), where \( w \) is the solution of Riccati–type equation, defined on \( \Omega(T) \). Since \( H(t,x) = \|\delta(t,x)\| = 0 \) for \( x \in \Omega(T) \setminus \Omega_{0,1}(T,t) \), we have

\[
\int_{\Omega(T,t)} \langle \delta(t,x), w(x) \rangle \, dx = \int_{\Omega(T,t)} H(t,x)(p-1)\rho^{1-q}(x)\|w(x)\|^{q} \, dx \\
= \int_{\Omega_{0,1}(T,t)} \left[ \langle \delta(t,x), w(x) \rangle \\
- H(t,x)(p-1)\rho^{1-q}(x)\|w(x)\|^{q} \right] \, dx. \tag{3.5}
\]
The following relation we obtain from (3.5) and from Hölder inequality
\[
\int_{\Omega(T,t)} \langle h(t, x), w(x) \rangle \, dx - \int_{\Omega(T,t)} H(t, x)(p - 1)\rho^{1-q}(x)||w(x)||^q \, dx
\]
\[
= \int_{T} \left[ \int_{S_{0,t}(s)} \langle h(t, x), w(x) \rangle \, dS - \int_{S_{0,t}(s)} H(t, x)(p - 1)\rho^{1-q}(x)||w(x)||^q \, dS \right] \, ds
\]
\[
\leq \int_{T} \left[ \left( \int_{S_{0,t}(s)} H^{1-p}(t, x)\rho(x)||h(t, x)||^p \, dS \right)^{\frac{1}{p}} \times \left( \int_{S_{0,t}(s)} H(t, x)\rho^{1-q}(x)||w(x)||^q \, dS \right)^{\frac{1}{q}} \right. \right. \leq \int_{S_{0,t}(s)} H(t, x)(p - 1)\rho^{1-q}(x)||w(x)||^q \, dS \right] \, ds
\]
Application of Young inequality (3.3) gives
\[
\int_{\Omega(T,t)} \langle h(t, x), w(x) \rangle \, dx - \int_{\Omega(T,t)} H(t, x)(p - 1)\rho^{1-q}(x)||w(x)||^q \, dx
\]
\[
\leq \int_{T} p^{-p} \int_{S_{0,t}(s)} H^{1-p}(t, x)\rho(x)||h(t, x)||^p \, dS \, ds
\]
\[
= \int_{\Omega(t_0, T)} p^{-p}H^{1-p}(t, x)\rho(x)||h(t, x)||^p \, dx
\]
Combining this inequality with (3.2) we conclude
\[
\int_{\Omega(t_0, T)} [H(t, x)\rho(x)c(x) - p^{-p}\rho(x)H^{1-p}(t, x)||h(t, x)||^p] \, dx
\]
\[
\leq \int_{\Omega(T)} H(t, x)\langle w(x), \nu \rangle \, dx \tag{3.6}
\]
and similarly as in the proof of Theorem 2.3, we obtain
\[
\int_{\Omega(t_0, t), t_0} [H(t, x)\rho(x)c(x) - p^{-p}\rho(x)H^{1-p}(t, x)||h(t, x)||^p] \, dx
\]
\[
\leq \int_{\Omega(t_0, T)} H(t, x)\rho(x)c(x) \, dx + \int_{\Omega(T)} H(t, x)\langle w(x), \nu \rangle \, dS
\]
\[
\leq \int_{t_0}^{T} \left[ \int_{S(t)} H(t, x) \, dS \right] k(s)\rho^*(s)c^*(s) \, ds + w^*(T) \int_{S(T)} H(t, x) \, dS
\]
\[
\leq k(t_0) \left[ \int_{\Omega(t_0, T)} H(t, x) \, dS \right] \left[ \int_{t_0}^{T} \rho^*(s)c^*(s) \, ds + w^*(T) \right],
\]
where \( w^*(s), \rho^*(s) \) and \( c^*(s) \) are the same as in the proof of Theorem 2.1. The last inequality contradicts (2.5). The proof is complete.

\[ \square \]

**Lemma 3.1.** Let the functions \( H, h, k \) and \( \rho \) satisfy the hypothesis (4)–(6) of Theorem 2.2. Suppose that (2.7), (2.9) and (2.10) holds. Let \( u \) be solution of (E) which is positive on \( \Omega(T_0) \) for some \( T_0 \geq t_0 \) and \( w(x) \) be the corresponding Riccati variable defined on \( \Omega(T_0) \) by (3.1). Then

\[
\liminf_{t \to \infty} \int_{T_0}^t \frac{\int_{S(s)} H(t, x) \rho^{1-q}(x) ||w(x)||^q dS}{k(s) \int_{S(s)} H(t, x) dS} ds < \infty. \quad (3.7)
\]

**Proof.** Let us denote

\[
F(t) = \left( \int_{S(T_0)} H(t, x) dS \right)^{-1} \int_{\Omega(T_0)} \|h(t, x)\| \cdot \|w(x)\| dx
\]

\[
G(t) = \left( \int_{S(T_0)} H(t, x) dS \right)^{-1} (p - 1) \int_{\Omega(T_0)} H(t, x) \rho^{1-q}(x) ||w(x)||^q dx
\]

for \( t > T_0 \). As in the proof of Theorem 2.2 we conclude (3.2) and hence

\[
G(t) - F(t) \leq \left( \int_{S(T_0)} H(t, x) dS \right)^{-1} \left[ \int_{S(T_0)} H(t, x) ||w(x)|| dS - \int_{\Omega(T_0)} H(t, x) \rho c(x) dx \right]
\]

\[
\leq w^*(T_0) - \left( \int_{S(T_0)} H(t, x) dS \right)^{-1} \int_{\Omega(T_0)} H(t, x) \rho c(x) dx \quad (3.8)
\]

holds for every \( t > T_0 \), where \( w^*(t) \) has been defined in the proof of Theorem 2.1. Hence by (2.10)

\[
\liminf_{t \to \infty} [G(t) - F(t)] \leq w^*(T_0) - A(T_0) < \infty. \quad (3.9)
\]

Suppose that (3.7) does not hold. Then

\[
\lim_{t \to \infty} \int_{T_0}^t \frac{\int_{S(s)} H(t, x) \rho^{1-q}(x) ||w(x)||^q dS}{k(s) \int_{S(s)} H(t, x) dS} ds = \infty. \quad (3.10)
\]

According to (2.9) there exists \( \eta \in \mathbb{R} \) such that

\[
0 < \eta < \inf_{s \geq t_0} \left\{ \liminf_{t \to \infty} \frac{k(s) \int_{S(s)} H(t, x) dS}{k(t_0) \int_{S(t_0)} H(t, x) dS} \right\} \quad (3.11)
\]

and for every \( \mu \in \mathbb{R}^+ \) there exists \( T_1 > T_0 \) such that

\[
\int_{T_0}^t \frac{(p - 1) \int_{S(s)} H(t, x) \rho^{1-q}(x) ||w(x)||^q dS}{k(s) \int_{S(s)} H(t, x) dS} ds \geq \frac{\mu}{\eta k(T_0)} \quad (3.12)
\]
for every $t \geq T_1$. Further there exists $T_2 > T_1$ such that
\[
\frac{k(T_1)}{k(t_0)} \int_{S(t_0)} H(t, x) \, dS > \eta \tag{3.13}
\]
for all $t \geq T_2$. From the definition of the function $G(t)$ it follows that for $t \geq T_2$
\[
G(t) = \left(\int_{S(t_0)} H(t, x) \, dS\right)^{-1} \int_{T_0}^{t} \left[\left(\frac{\partial}{\partial s} \left(\int_{S(s)} H(t, x) \, dS\right)\right) - \frac{\partial}{\partial s} \left(\int_{S(s)} H(t, x) \, dS\right)\right] \, ds
\]
holds. Integration by parts and the property (i) of the function $G(t)$ imply
\[
G(t) \geq \left(\int_{S(T_0)} H(t, x) \, dS\right)^{-1} \int_{T_0}^{t} \left[\left(\frac{\partial}{\partial s} \left(\int_{S(s)} H(t, x) \, dS\right)\right) - \frac{\partial}{\partial s} \left(\int_{S(s)} H(t, x) \, dS\right)\right] \, ds
\]
and in view of (iii)
\[
G(t) \geq \left(\int_{S(T_0)} H(t, x) \, dS\right)^{-1} \int_{T_0}^{t} \left[\left(\frac{\partial}{\partial s} \left(\int_{S(s)} H(t, x) \, dS\right)\right) - \frac{\partial}{\partial s} \left(\int_{S(s)} H(t, x) \, dS\right)\right] \, ds.
\]
Application of (3.12) gives
\[
G(t) \geq \left(\int_{S(T_0)} H(t, x) \, dS\right)^{-1} \int_{T_1}^{t} \left[\frac{\partial}{\partial s} \left(\int_{S(s)} H(t, x) \, dS\right)\right] \, ds
\]
\[
\geq \frac{\mu k(T_1)}{\eta k(T_0)} \int_{S(T_0)} H(t, x) \, dS.
\]
In view of (iii)
\[
G(t) \geq \frac{\mu k(T_1)}{\eta k(t_0)} \int_{S(t_0)} H(t, x) \, dS
\]
and (3.13) implies
\[
G(t) \geq \mu \tag{3.14}
\]
for every $t \geq T_2$. Since $\mu$ has been chosen arbitrary, $\lim_{t \to \infty} G(t) = \infty$. Let us consider the sequence $\{t_n\}_{n=1}^{\infty}$ of the points from $(T_2, \infty)$ such that $\lim_{n \to \infty} t_n = \infty$ and $\lim_{n \to \infty} [G(t_n) - F(t_n)] = \lim \inf_{t \to \infty} [G(t) - F(t)]$. In view of (3.9) there exists real constant $M$ with property
\[
G(t_n) - F(t_n) \leq M \tag{3.15}
\]
for all \( n \). Hence
\[
\lim_{n \to \infty} F(t_n) = \lim_{n \to \infty} G(t_n) = \infty. \tag{3.16}
\]
From (3.15) and (3.16) we obtain
\[
\frac{F(t_n)}{G(t_n)} - 1 \geq -\frac{M}{G(t_n)} > -\frac{1}{2}
\]
for large \( n \). Hence
\[
\frac{F(t_n)}{G(t_n)} > \frac{1}{2}
\]
for large \( n \) and combination of this inequality with (3.16) yields
\[
\lim_{n \to \infty} \frac{F(p)(t_n)}{G^{p-1}(t_n)} = \infty. \tag{3.17}
\]
However the definition of the function \( F(t) \) and the Hölder inequality give
\[
F(t) \leq \left[ \left( \int_{S(T_0)} H(t, x) \, dS \right)^{-1} \int_{\Omega(T_0, t)} (p - 1)H(t, x)\rho^{1-\eta}(x) ||h(t, x)||^p \, dx \right]^{\frac{1}{q}}
\]
\[
\times \left[ \left( \int_{S(T_0)} H(t, x) \, dS \right)^{-1} \int_{\Omega(T_0,t)} (p - 1)^{1-p}H^{1-p}(t, x)\rho(x) ||h(t, x)||^p \, dx \right]^{\frac{1}{p}}
\]
\[
\leq [G(t)]^{\frac{1}{q}} \left[ \left( \int_{S(T_0)} H(t, x) \, dS \right)^{-1} \int_{\Omega(T_0, t)} (p - 1)^{1-p}H^{1-p}(t, x)\rho(x) ||h(t, x)||^p \, dx \right]^{\frac{1}{p}}
\]
and therefore
\[
\frac{F^p(t)}{G^{p-1}(t)} \leq (p - 1)^{1-p} \left( \int_{S(T_0)} H(t, x) \, dS \right)^{-1}
\]
\[
\times \int_{\Omega(T_0, t)} (p - 1)^{1-p}H^{1-p}(t, x)\rho(x) ||h(t, x)||^p \, dx.
\]
Since by (3.11)
\[
\frac{k(T_0) \int_{S(T_0)} H(t, x) \, dS}{k(t_0) \int_{S(S(t_0))} H(t, x) \, dS} \geq \eta
\]
for large \( t \), we have
\[
\frac{F^p(t)}{G^{p-1}(t)} \leq (p - 1)^{1-p}\eta^{-1} \left( k(T_0) \int_{S(T_0)} H(t, x) \, dS \right)^{-1}
\]
\[
\times k(T_0) \int_{\Omega(T_0, t)} (p - 1)^{1-p}H^{1-p}(t, x)\rho(x) ||h(t, x)||^p \, dx.
\]
\[
(3.18)
\]
If (3.17) would hold we obtain a contradiction with (2.7) This contradiction completes the proof.

□

Proof of Theorem 2.3 Suppose that equation (E) is not oscillatory and \( u \) is a solution of (E) positive on \( \Omega(T_0) \) for some \( T_0 \geq t_0 \). Let \( w(x) \) be Riccati variable defined by (3.1). As in the proof of Theorem 2.2 we conclude (3.6) and hence by (2.10)

\[
A(T) \leq \frac{\int_{S(T)} H(t,x) ||w(x)|| dS}{\int_{S(T)} H(t,x) dS}
\]

(3.19) for every \( t > T > T_0 \). Hence

\[
A(T) \int_{S(T)} H(t,x) dS \leq \int_{S(T)} H(t,x) ||w(x)|| dS
\]

for all \( t > T \). Hölder inequality gives

\[
A(T) \int_{S(T)} H(t,x) dS \leq \left( \int_{S(T)} H(t,x) \rho^{1-q}(x) ||w(x)||^q dS \right)^{\frac{1}{q}} \times \left( \int_{S(T)} H(t,x) \rho(x) dS \right)^{\frac{1}{q}}.
\]

Hence

\[
(A+T)^q \left( \int_{S(T)} H(t,x) dS \right)^q \leq \int_{S(T)} H(t,x) \rho^{1-q}(x) ||w(x)||^q dS \times \left( \int_{S(T)} H(t,x) \rho(x) dS \right)^{q-1}
\]

and the definition of the function \( \hat{\rho} \) yields

\[
(A+T)^q \left( \int_{S(T)} H(t,x) dS \right)^{1-q} \leq \left( \int_{S(T)} H(t,x) dS \right)^{-1} \int_{S(T)} H(t,x) \rho^{1-q}(x) ||w(x)||^q dS
\]

for \( t > T > T_0 \). This inequality combined with (3.7) contradicts to (2.11). The proof is complete.

□

Lemma 3.2. Let the functions \( H, h, k \) and \( \rho \) satisfy the hypothesis (i)–(iv) and of Theorem 2.2. Suppose that (2.9), (2.10) and (2.13) holds. Let \( u \) and \( w \) be the same as in Lemma 3.1. Then (3.7) holds.

Proof. As in the proof of Theorem 2.2 we see that (3.2) holds. With the notation of Lemma 3.1 inequality (3.8) holds. Hence

\[
\limsup_{t \to \infty} [G(t) - F(t)] \leq w^*(T_0) - \liminf_{t \to \infty} \left( \int_{S(T_0)} H(t,x) dS \right)^{-1} \times \int_{\Omega(t_0,t)} H(t,x) \rho(x) c(x) dx
\]

\[
\leq w^*(T_0) - A(T_0) < \infty.
\]

(3.20)
By (2.10)
\[ A(t_0) \leq \left( \int_{S(t_0)} H(t, x) \, dS \right)^{-1} \int_{\Omega_{0,t}(t_0,t)} \left[ H(t, x) \rho(x) c(x) - \frac{||h(t, x)||^p \rho(x)}{p^p H^{p-1}(t, x)} \right] \, dx \]
for \( t \geq t_0 \). Hence by (2.13)
\[ \liminf_{t \to \infty} \left( \int_{S(t_0)} H(t, x) \, dS \right)^{-1} \int_{\Omega_{0,t}(t_0,t)} \left[ H(t, x) \rho(x) c(x) \right] \, dx - A(t_0) < \infty. \] (3.21)

Let us consider the sequence \( \{t_n\}_{n=1}^{\infty} \) in \((T_0, \infty)\) satisfying \( \lim_{n \to \infty} t_n = \infty \) and
\[ \lim_{n \to \infty} \left( \int_{S(t_0)} H(t_n, x) \, dS \right)^{-1} \int_{\Omega_{0,t}(t_0,t)} \left[ H(t_n, x) \rho(x) c(x) \right] \, dx = \liminf_{t \to \infty} \left( \int_{S(t_0)} H(t, x) \, dS \right)^{-1} \int_{\Omega_{0,t}(t_0,t)} \left[ H(t, x) \rho(x) c(x) \right] \, dx. \]
Now suppose by contradiction that (3.7) fails. As in the proof of Lemma 3.1 and using (3.20) we conclude (3.16). Using the same procedure as in Lemma 3.1 we obtain (3.17) and (3.18), which contradicts to (3.21). Hence (3.7) holds. □

Proof of Theorem 2.4. The proof is almost the same as the proof of Theorem 2.3. Lemma 3.2 is applied instead of Lemma 3.1 □

REFERENCES
