1. Rate of change – linear growth

Slope of the line (denoted by k) and evaluated as a the quotient of the **vertical** and corresponding **horizontal** change is a convenient tool which measures the rate of growth.

2. Rate of change – nonlinear growth

The rate of change of nonlinear function at a point is defined as the rate of change of the best linear approximation (tangent) at this point. This rate may change along the curve.

We have to find the slope of the tangent.

3. Tangent

It is easy to find the slope of the secant (we have two points of the line).
Tangent can be considered as a limit position of secants.

4. "Approaching" 1

Limit process $\lim_{x \rightarrow 0^+} \frac{\sin x}{x}$

It holds $\lim_{x \rightarrow 0^+} \frac{\sin x}{x} = 1$

5. "Approaching" 2

Limit process $\lim_{x \rightarrow 0^+} \frac{1}{x}$

It holds $\lim_{x \rightarrow 0^+} \frac{1}{x} = \infty$

6. "Approaching" 3

Limit process $\lim_{x \rightarrow \infty} \frac{1}{x}$

Plat $\lim_{x \rightarrow \infty} \frac{1}{x} = 0$

7. Definition of the limit

- From the picture it seems that $f(x)$ approaches L if x approaches a
- Now we will define exactly the limit – a mathematical description of the fact that “something approaches something”.

- The **neighborhood** of the point b is every open interval which contains this point.
- The **ring neighborhood** of the point b is the neighborhood of b , with exception of the point b .

- For every neighborhood of the point L we can find a ring neighborhood of the point a such that the image of all points from this ring neighborhood belongs to the neighborhood of the point L .
- The value $f(a)$ plays no role in our investigations. It may be arbitrary or remain undefined.

- We consider smaller neighborhood of the point L (yellow strip).
- Values at some of the points in the neighborhood of the point a (the top of gray set) is outside the yellow strip.

- For **every** neighborhood of the point L we can find a ring neighborhood of the point a such that the values of all points in this neighborhood belong to the neighborhood of the point L .

Definice 1 (definition of limit) If the above condition is fulfilled, then we say that the limit of the function f at the point a is L . We write

$$\lim_{x \rightarrow a} f(x) = L.$$

- For this neighborhood of the point L there is no neighborhood of the point a with the property from the definition of the limit.
- The point L_1 is not the limit of the function at a .
- Similarly, neither L_2 nor any other number is the limit at a . The function possesses no limit at the point a .

- **BUT:** For every neighborhood of L_1 we can find a **right** ring neighborhood of the point a such that all points from this neighborhood have images in the neighborhood of the point L_1 .

Definice 2 (definition of one-sided limit) If the last condition holds, we say that the limit of the function f at the point a equals L_1 . We write

$$\lim_{x \rightarrow a^+} f(x) = L_1 .$$

8. Tangent

It is easy to find the slope of the secant (we have two points of the line).
Tangent can be considered as a limit position of secants.

9. Derivative

Definice 3 (derivative of the function) Let $x \in D(f)$. The function f has *derivative at the point* x if the finite limit

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \quad (1)$$

exists.
